give an introduction into the meteorological boundary conditions for power generation from the wind, onshore and offshore. It is to provide reliable meteorological information for the planning and running of this important kind of renewable energy. This includes the derivation of wind laws and wind profile descriptions, especially those above the logarithmic surface layer.

The role of meteorology in the energy sector was the subject of an international conference in Boulder, Colorado, in June. David Richardson, who attended the event for ECMWF, explains why the growth in renewable energy is boosting demand for weather prediction across all timescales. Weather forecasts have long been important to the energy sector.

Description Meteorology. The National Weather Service defines Santa Ana winds as "Strong down slope winds that blow through the mountain passes in southern California. These winds, which can easily exceed 40 miles per hour (64 km/h), are warm and dry and can severely exacerbate brush or forest fires, especially under drought conditions."
